

# Custody Tracking System (CTS) for PDA

The Custody Tracking System (CTS) desktop application provides an automated means for Navy personnel to perform all functions relating to issue, turn-in/rotatable pool and custody tracking process for SPECWARCOM and Seabees.

The new CTS for PDA application allows Navy personnel to download this data to a PDA

and track issue and turn-in information on the handheld platform. It makes the process even simpler by providing barcode scanning capabilities. (To use these capabilities, the app must be run on a handheld device with a barcode scanner integrated into the hardware.)

1

A simple query in the CTS desktop system produces the personnel and equipment data you will need on the PDA. The press of a button performs a Hot-Sync operation to download the data to the PDA.

2

With all the data you need on the PDA, you can issue equipment to personnel or record equipment turn-in simply by tapping a name, then entering the quantity of the item. Because your PDA is mobile, you're free to track equipment wherever you are.

3

When you get back to your workstation, sync the PDA to the PC once again to instantly transfer issue and turn-in data back to CTS. This data is stored in a special directory until a CTS user imports it into the system, at which time CTS records are updated to reflect the items issued and turned in, so data never has to be entered twice.
